Bonsoir Si Youssef,
Nous avons pu résoudre le Journalisme de la sorte :

```
// Dans AppController :
public function beforeFilter(Event $event)
{
    parent::beforeFilter($event);
    $id = null;
    if( !empty( $this->request->session()->read('Auth.User.log_id') ) )
    {
        $id = $this->request->session()->read('Auth.User.log_id');
    }

    updateLog($id);
}

// Qui appel la fct :
function updateLog($id = null)
{
    $now = Time::now();
    $Logs = TableRegistry::get('Logs');
    $logs = $Logs->find("all");
    foreach ($logs as $key => $log)
    {
        $du = new Time($log->updated);
        $dec = $log->deconnected;
        $interval = $now->diff($du);
        $interval = calculateMinutes($interval);
        if(($dec == null) && ($interval >= 10))
        {
            $log->deconnected = $now;
            $Logs->save($log);
        }
        elseif ($id != null && $id == $log->ID)
        {
            $log->updated = $now;
            $Logs->save($log);
        }
    }
}

function calculateMinutes($int){
    $days = $int->format('%a');
    return ($days * 24 * 60) + ($int->h * 60) + $int->i;
}
```

Et Dans UsersController :

```php
public function login()
{
 if ($this->request->is('post'))
 {
 $user = $this->Auth->identify();
 if ($user)
 {
 $this->Auth->setUser($user);
 $log = $this->Logs->newEntity();

 $log->user_id = $this->request->session()->read('Auth.User.ID');
 $log->updated = Time::now();
 $log = $this->Logs->save($log);
 $this->request->session()->write('Auth.User.log_id',$log->ID);
 return $this->redirect($this->Auth->redirectUrl());
 }
 else
 {
 $this->Flash->error(__("Nom d'utilisateur ou mot de passe incorrect"));
 }
 }
}

public function logout()
{
    $log = $this->Logs->get($this->request->session()->read('Auth.User.log_id'));
    if($log->deconnected == null)
    {
        $log->deconnected = Time::now();
        $log = $this->Logs->save($log);
    }
 $this->redirect($this->Auth->logout());
}
```

Puis dans le Head du App\src\Template\Layout\default.ctp :

```html
<META HTTP-EQUIV="Refresh" CONTENT="600"> // un refresh après 10min
```

Nous aimerions savoir vos impressions sur cette solution.
Cordialement
